

Clubroot disclaimer

When it is indicated that a variety has high resistance (HR) to clubroot, this means that the variety has high resistance to the indicated races of *Plasmodiophora brassicae*, the cause of Clubroot. However, if the soil is contaminated with the Clubroot fungus, then the grower should first test the variety in order to confirm that it is resistant to the strains present. Cultivation measures such as liming, drainage, application of calcium fertilizer and good crop rotation can help to reduce the incidence and severity of Clubroot.
